

# GERMINATION TEST

To set up the test, fold a paper towel and spray it with a water bottle. Then lay 3-5 seeds of each variety on the paper towel. Place paper towel inside of a plastic bag. Leave the bag open for air flow, and then tape the bag to a sunny window. Check daily to see what has sprouted.

Some seeds take longer to germinate than others. For example, pepper seeds can take 2 weeks, while radishes may take just a day.
